

Parking lot USB exercise

Contents	<i>The files on the USB device contain a mix of personal and work files, which is an unsafe practice. There are sensitive work files on the USB drive and files containing PII.</i>
Attacker mindset	<i>This information can be used against Jorge and the hospital because it contains sensitive PII information and sensitive information about the hospital's operations. If this information were leaked, it would have serious negative effects.</i> <i>Timesheets on the device can provide an attacker with intel about other people that Jorge works with. Either work or personal information could be used to trick Jorge. For example, a malicious email can be designed to look as though it comes from a coworker or relative.</i>
Risk analysis	<i>Promoting employee awareness about these types of attacks and what to do when a suspicious USB drive is a managerial control that can reduce the risk of a negative incident. Setting up routine antivirus scans is an operational control that can be implemented. Another line of defence could be a technical control, like disabling AutoPlay on company PCs, which will prevent a computer from automatically executing malicious code when a USB drive is plugged in.</i>
